

Reducing Pollution and Waste

In 1989, when California enacted landmark legislation AB 939 to divert 50% of solid waste from landfills, it spurred the development of an extensive job-creating recycled materials collection infrastructure. As a result, California leads the nation in diverting 54% of all of its waste from landfills. Now, California aims to reduce more than 15 million tons of waste annually and the pollution generated

through decomposing waste at local landfills. The State mandated diversion level of AB341 is 75%.

In response to the new State mandate AB 341, VVS has elected to utilize mixed waste processing to ensure full State compliance. In short, the cities in which we operate will meet and exceed State requirements without significantly increasing truck traffic throughout the community.

Commercial and Multi-Family waste is processed through a fully permitted material recovery facility (MRF) for optimum landfill diversion. Grand Central Recycling and Transfer Station (GCR), is equipped with the state of the art mechanical sorting equipment specifically designed to process waste for the optimum recovery of recyclable commodities.

Utilizing mechanical, optical and manual processes, Valley Vista Services and Grand Central Recycling can assure you that every effort is being made to divert your recyclable materials from local landfills.
